1 INTRODUCTION

1.1 BIN

The BIN product family from Zennio consists of a variety of small-size KNX interfaces, designed to be installed, for instance, inside electric appliance boxes. They allow connecting a variable number of **binary inputs** (pushbuttons, switches) while they also provide **LED and electronic relay control outputs** (up to 12V DC, 2 mA). Therefore, the same device is able to provide feedback to the LED indicators incorporated by many pushbuttons and switches or to operate low-current relays (e.g., heating system relays).

The BIN product family also incorporates the **Heartbeat** function, which consists in sending a periodical “still-alive” notification to the KNX bus.

The **number of input and output channels** depends on each specific model, being fixed in some of them or configurable by the integrator in those models where a sole channel can work either as an input or as an output:

1.1.1 BIN 44

- **4 fixed inputs**, configurable as:
 - Binary inputs.
- **4 fixed outputs**, configurable as:
 - LED lighting outputs.
 - Electronic relay control outputs (heating actuators).

1.1.2 BIN 4X

- **4 input / output channels**, freely configurable as:
 - Binary inputs.
 - LED Lighting Output.
 - Electronic Relay Control (Heating Actuator).

1.1.3 BIN 2X

- **2 input / output channels**, freely configurable as:

- Binary inputs.
- LED Lighting Output.
- Electronic Relay Control (Heating Actuator).

1.2 INSTALLATION

BIN is connected to the KNX bus through the incorporated terminal connector, while the input lines are connected to BIN through a screw terminal block, bundled with the stripped cables already connected.

Once the device is provided with power from the KNX bus, both the individual address and the associated application program may be downloaded.

This device does not need any additional external power since it is entirely powered through the KNX bus.

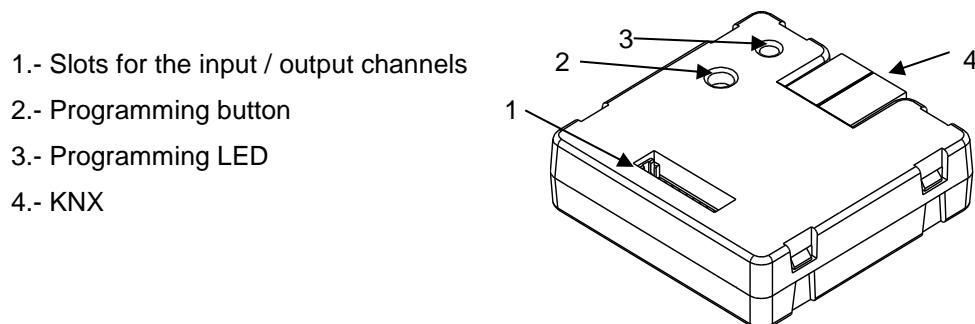

Figure 1. Element diagram.

The main elements are described next:

- **Prog./Test Button (2):** a short press on this button sets the device into the programming mode, making the associated LED (3) light in red. If this button is held at the same time of applying bus power to the device, BIN will enter the Safe Mode. In such case, the LED will intermit in red.
- **Slots for the input / output lines:** slot for the insertion of the terminal block with cables (see Figure 2) that permits BIN interfacing with the different input and output elements.

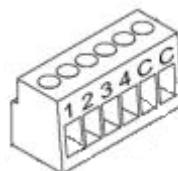

Figure 2. Input / output terminal block

To obtain further information about the technical features of BIN 44 / 4X / 2X and on security and installation procedures, please refer to the **Datasheet** of the device, bundled with the original packaging and also available at the <http://www.zennio.com> website.

2 CONFIGURATION

2.1 GENERAL

After importing the corresponding database in ETS and adding the device into the topology of the desired project, the configuration process begins by entering the Parameters tab of the device.

ETS PARAMETERISATION

The only parameterisable screen available by default is General. From this screen it is possible to activate/deactivate all the required functionality.

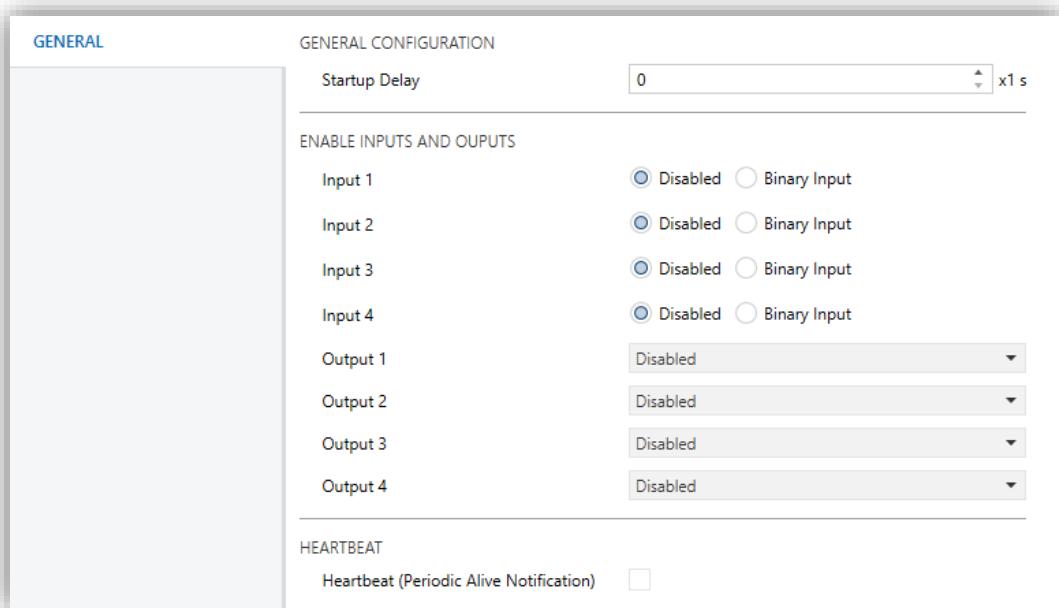

Figure 3. Default configuration (BIN 44).

- **Start-up Delay [0...255]¹:** sets a delay after the initialisation so the device does not respond to orders nor send objects to the bus (except the Heartbeat object, if enabled; see below).
- **Input / Output x [Disabled/Binary Input/LED Lighting Output/Electronic Relay Control (Heating Actuator)]:** checkboxes that allow selecting which inputs and

¹ The default values of each parameter will be highlighted in blue in this document, as follows: [default/rest of options].

outputs will be functional (or which channels will behave as inputs and which channels as outputs, in the case of BIN 44, see Figure 4). After enabling them, additional tabs will be incorporated to the tab tree on the left. These functions and their parameters will be explained in later sections of this document.

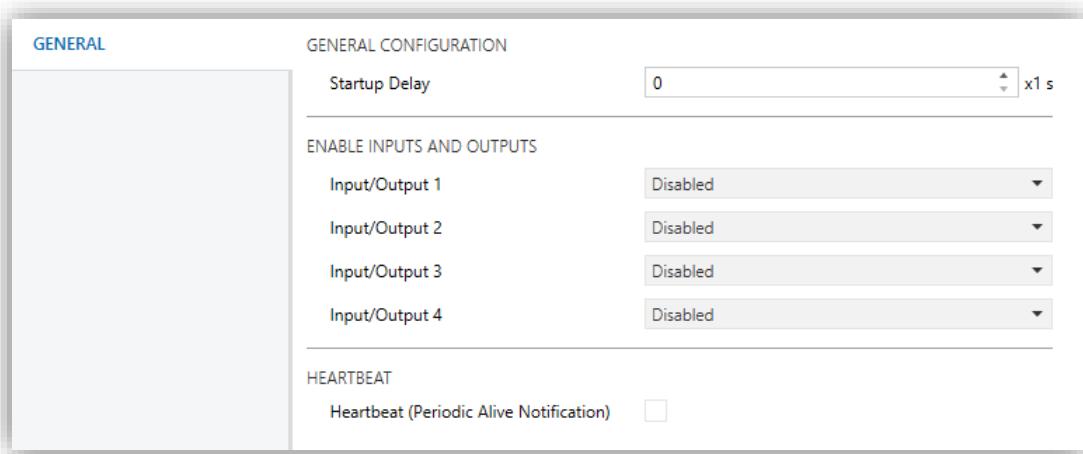

Figure 4. Default configuration (BIN 4X).

- **Heartbeat (Periodic Alive Notification)** [[enabled](#)/[disabled](#)]: lets the integrator incorporate a one-bit object to the project (“[Heartbeat] Object to Send ‘1’”) that will be sent periodically with value “1” to notify that the device is still working (*still alive*).

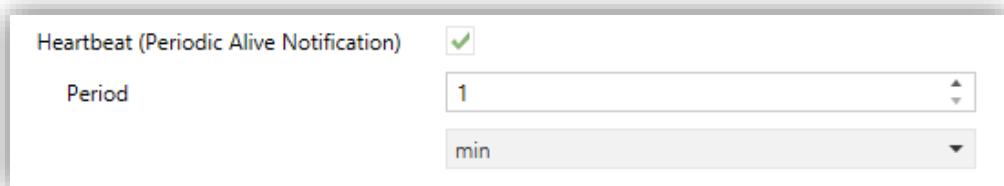

Figure 5. Heartbeat (Periodic Alive Notification).

Note: *the first sending after download or bus failure takes place with a delay of up to 255 seconds, to prevent bus overload. The following sendings match the period set.*

2.2 INPUTS / OUTPUTS

2.2.1 BIN 44

BIN 44 incorporates **four inputs** and **four outputs**, configurable as:

- **Inputs:** pushbuttons or switches. See section 2.2.3.
- **Outputs:**
 - **Low-current LED lighting controls**, for low current LED control. Brightness level, simple timer or flashing can be configured. See section 2.2.4.
 - **Electronic relay controls** for heating systems. See section 2.2.5.

2.2.2 BIN 4X / 2X

BIN 4X and BIN 2X incorporate, respectively, **four or two input/output channels**, each of them configurable as a:

- **Binary Input.** See section 2.2.3.
- **LED Lighting Output.** See section 2.2.4.
- **Electronic Relay Control (Heating Actuator).** See section 2.2.5.

2.2.3 BINARY INPUT

Please refer to the “**Binary Inputs**” user manual, available in the BIN product section at the Zennio website (<http://www.zennio.com>).

2.2.4 LED LIGHTING OUTPUT

The LED lighting control permits commuting each LED between two states: **off** (which not necessarily means “no light”) and **on** (which not necessarily means “light on”). Moreover, the LEDs can also switch between two operation modes: the **normal mode** and the **night mode**. The second one is optional and is provided for temporary situations and environments where an excess of brightness may disturb the user. In

such cases, it will be possible to switch the mode by means of a one-bit object and/or a scene object.

These settings are common for all outputs configured as LEDs. On the contrary, **timers**, **flashing** and **status objects** can be configured independently for each output.

2.2.4.1 GENERAL CONFIGURATION

The general configuration of the LED outputs entails setting the brightness levels for the on and off states, both for the normal mode and for the night mode (if required).

ETS PARAMETERISATION

A general Configuration tab for the LED Outputs function is provided once at least one output has been configured as a LED Lighting Output. This tab contains the settings that are common to all LED outputs.

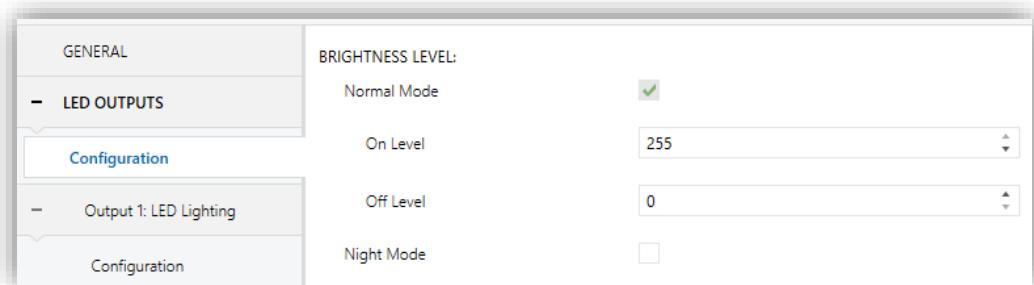

Figure 6. LED Outputs - General configuration.

• **Normal Mode** [enabled]:

- **On Level** [0...255]: sets the brightness level value for on state.
- **Off Level** [0...255]: sets the brightness level values for off state.

• **Night Mode** [enabled/disabled]: in case of being this mode necessary, this checkbox needs to be marked:

- **On Level** [0...8...255]: sets the brightness level values for on state.
- **Off Level** [0...255]: sets the brightness level values for off state.

In case of enabling the night mode, some more options can be configured:

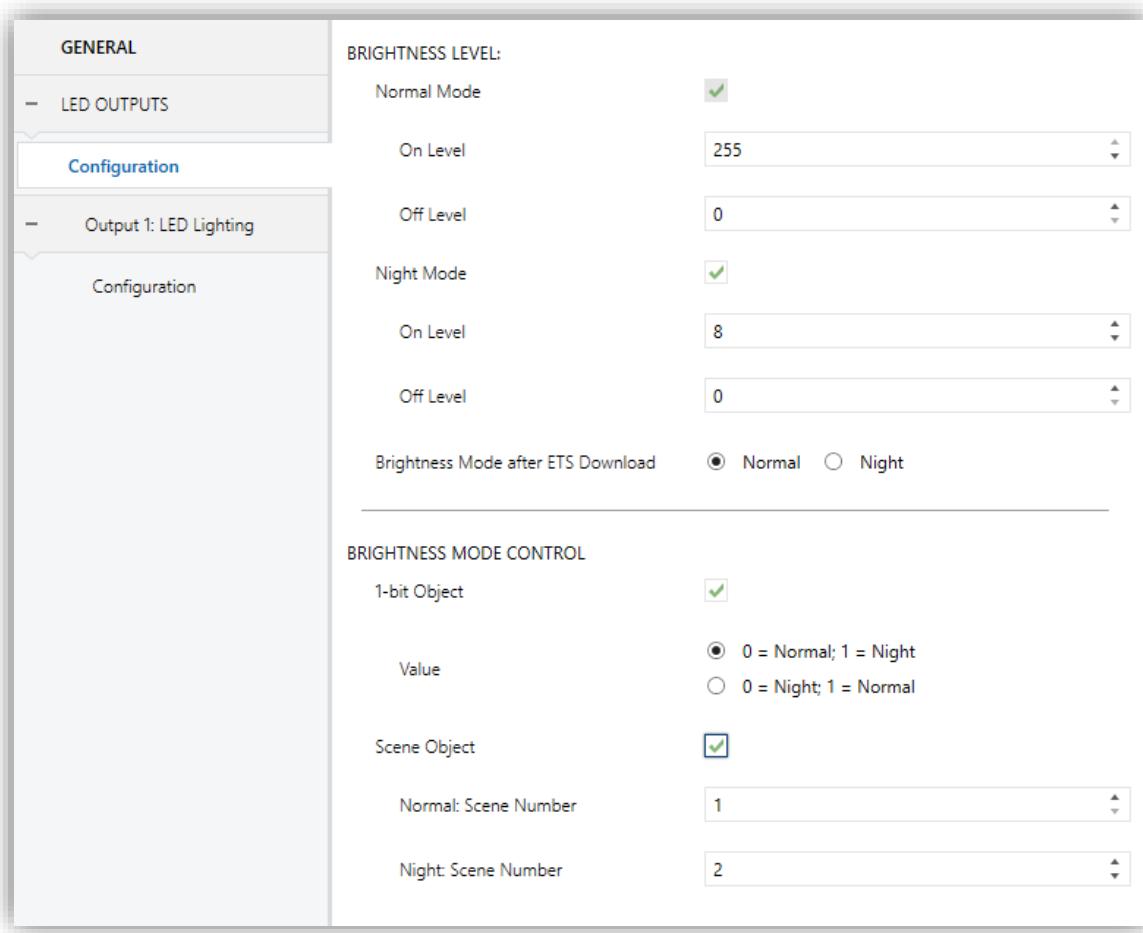

Figure 7. LED Outputs - General Configuration - Night Mode

- **Brightness Mode after ETS download** [Normal/Night]: sets which of the two modes will be active after an ETS Download.
- **1-bit Object** [enabled/disabled]: when marked, it will be possible to switch the mode by writing to a binary object ("[LED] Brightness Mode"). The parameter **Value** (0 = Normal; 1 = Night / 0 = Night; 1 = Normal) will show up to select which value should trigger which mode.
- **Scene Object** [enabled/disabled]: when marked, it will be possible to switch the mode by writing a certain scene value to "[LED] Scene". Two specific textboxes will show up to enter what scenes (1 through 64) will trigger each mode.

2.2.4.2 OUTPUT X: LED LIGHTING – CONFIGURATION

As already stated, each LED output allows an independent configuration of its **status object**, **timer** and **flashing** functions.

The **Timer** function consists in performing a single, timed switch-on / switch-off cycle when a specific trigger object is received.

On the other hand, the **Flashing** function consists in performing a continuous, timed on/off sequence when a specific trigger object is received.

ETS PARAMETERISATION

A specific Configuration tab is provided for each enabled LED output. It contains the following parameters:

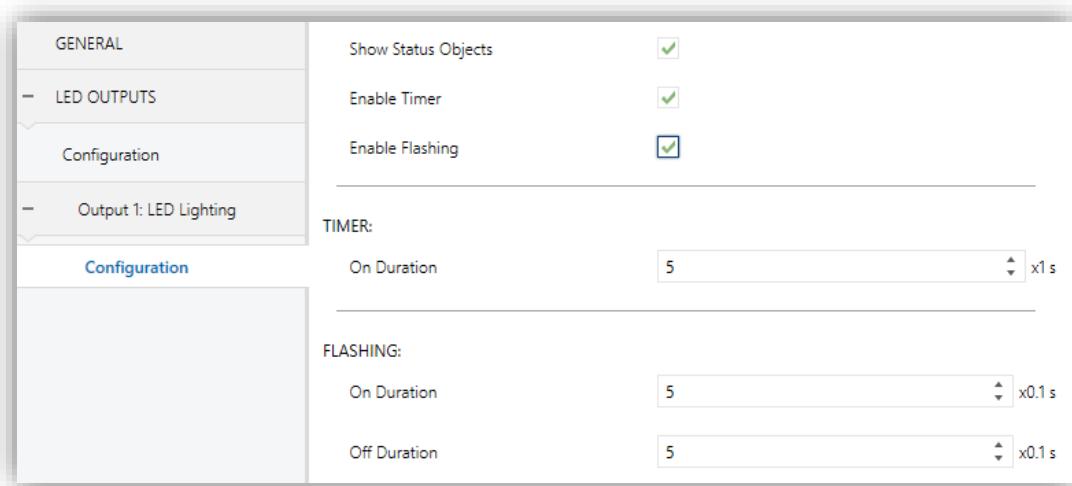

Figure 8. Ouput X: LED Lighting – Configuration.

- **Show Status Objects** [enabled/disabled]: if enabled, the “[LEDx] LED Status” object is added to the project. It takes value ‘0’ when the LED is in the off state and value ‘1’ when the LED is in the on state. This object is sent to the bus whenever the status is updated.
- **Enable Timer** [enabled/disabled]: enables the timer function.
 - **On Duration** [0...5...255]: sets how much time the output will remain in the on state once the timer is activated. If set to zero, the output will not switch off afterwards.

- **Enable Flashing [enabled/disabled]**: enables the flashing function.

- **On Duration [1...5...255]**: length of each “on” stage.
- **Off Duration [1...5...255]**: length of each “on” stage.

The following objects are also related to the functionality of each LED output:

- “[LEDx] On/Off” (binary): when it receives the value “1”, the LED will switch to the on state, while the value “0” will switch it off.
- “[LEDx] Inverted On/Off” (binary): performs an inverse control of the LED. When it receives the value “0”, the LED will switch to the on state, while the value “1” will switch it off.
- “[LEDx] Timer” (binary): when it receives the value “1”, the LED timer function will start, while the value “0” will stop it.
- “[LEDx] Flashing” (binary): when it receives the value “1”, the LED flashing function will trigger, while the value “0” will stop it.

2.2.5 ELECTRONIC RELAY CONTROL (HEATING ACTUATOR)

Please refer to “**Electronic Relay Control in Heating Systems**” specific manual, available in the BIN product section at the Zennio website, <http://www.zennio.com>.

Note: *BIN does not implement the following options, although they are included in the above document:*

- Overload/short-circuit notification.
- Start-up delay (the general start-up delay is applied instead; see section 2.1).

ANNEX I. COMMUNICATION OBJECTS

- “Functional range” shows the values that, with independence of any other values permitted by the bus according to the object size, may be of any use or have a particular meaning because of the specifications or restrictions from both the KNX standard or the application program itself.

Number	Size	I/O	Flags	Data type (DPT)	Functional Range	Name	Function
1, 7, 13(*), 19(*)	1 Bit	I	C - - W -	DPT_Switch	0/1	[Ix] Input Lock	0 = Unlock; 1 = Lock
	1 Bit		C T - - -	DPT_Switch	0/1	[Ix] [Short Press] 0	Sending of 0
